British Microlepidoptera

An unusual 'intermediate' form of *Cydalima perspectalis* (Walk.) **Box-tree Moth**, [63.054] was recorded from my coastal garden in Middleton-on-Sea, West Sussex, (SU 982004 [VC13]) this year. It came to a 125w MV trap on 7.ix.2023. It is predominantly melanic but has a white thorax, tegulae and abdomen. Examples from the same site of the typical form (20.x.2017, 125w MV trap) and melanic form (12.ix.2020, 40w Actinic trap) are also exhibited for comparison.
